

Project Progress

Everything completed so far, at a glance

✓ Phase 0 — Project Setup & Foundations

- Set up the complete project structure for both the automated agent and the dashboard
- Built and connected the Python program that will run the daily outreach process
- Built the dashboard's foundation using React, designed to work on laptop and iPhone alike
- Prepared the dashboard so it can be installed as an app on a phone's home screen
- Set up secure, organised version control for the whole project on GitHub

✓ Phase 1 — Database Setup

- Designed and created the full database: nine organised tables covering leads, messages, accounts, and more
- Locked the database down with security rules so only approved accounts can ever access it
- Built the connection layer that lets the program read and write data reliably
- Tested everything live against the real database and confirmed it works end to end

✓ Phase 2 — Account Safety & Session Isolation

- Built a system that manages all three outreach accounts and keeps track of when each should run
- Gave each account its own fully separate, private session — verified live with zero mixing between accounts
- Added automatic problem detection: any issue is paused and clearly explained, with the final decision always left to Hussein
- Ran full live tests, including a deliberate failure scenario, and confirmed every part worked correctly

Nexaris AI Outreach Agent · Phases 0–2 complete · 27 July 2026
